

Kotlin 日期時間

得到現時日期

// 方法 1: 完整日期時間 (年/月/日/時/分/秒/納秒)

```
val now = LocalDateTime.now()
```

// 方法 2: 只取日期

```
val today = LocalDate.now()
```

// 方法 3: 取得毫秒時間戳

```
val timestamp = System.currentTimeMillis()
```

按指定格式輸出字符串

```
val formatter1 = DateTimeFormatter.ofPattern("yyyy-MM-dd HH:mm:ss")
println(now.format(formatter1)) // 2024-01-15 14:30:45
```

```
val formatter2 = DateTimeFormatter.ofPattern("MM月dd日 HH時mm分ss秒")
println(now.format(formatter2)) // 01月15日 14時30分45秒
```

```
val formatter3 = DateTimeFormatter.ofPattern("dd MMM yyyy, EEEE HH:mm",
Locale.ENGLISH)
println(now.format(formatter3)) // 15 Sep 2024, Monday 14:30
```

```
val formatter4 = DateTimeFormatter.ofPattern("hh:mm a")
println(now.format(formatter4)) // 02:30 PM
```

<code>a</code>	AM 或 PM	
<code>HH</code>	24小時制	16:00
<code>hh</code>	12小時制	04:00
<code>MMM</code>	月份縮寫	Jan, Feb, Mar, Sep
<code>MMMM</code>	月份完整名稱	January, February, September
<code>EEE</code>	星期縮寫	Mon, Tue, Wed
<code>EEEE</code>	星期完整名稱	Monday, Tuesday, Wednesday

字符串轉成時間

```
val dateTimeString = "2024-01-15T14:30:45"  
val dateTime = LocalDateTime.parse(dateTimeString)
```

```
val dateString = "2024-01-15"  
val date = LocalDate.parse(dateString)
```

判斷兩個時間先後

```
val time1 = LocalDateTime.of(2024, 3, 1, 12, 0, 0)
val time2 = LocalDateTime.of(2024, 3, 1, 13, 0, 0)
val time3 = LocalDateTime.of(2024, 3, 1, 12, 0, 0)

// 方法 1: 使用 isBefore / isAfter / isEqual
println(time1.isBefore(time2))    // true (time1 在 time2 之前)
println(time2.isAfter(time1))    // true (time2 在 time1 之後)
println(time1.isEqual(time3))    // true (time1 等於 time3)

// 計算相差天數 (精確到天)
daysBetween = ChronoUnit.DAYS.between(start, end)
```

加減時間

```
val minus30Minutes = now.minusMinutes(30)
val plus30Minutes = now.plusMinutes(30)
val nextWeek = now.plusWeeks(1)           // 一週後
```

時間戳轉為時間

```
val timestamp = 1714986000L // Example in seconds
val date = Date(timestamp * 1000L) // Convert seconds to
milliseconds
```

```
val timestamp4 = Date().time           // 轉為時間戳
```
